### Child Welfare Law

The Child Welfare Bill became law 21 November, and will become effective 1 January 1948 (with the exception of certain articles which become effective 1 April 1948). Copies of the law in English, when available, will be furnished Military Government Teams. Most important provisions of the law are:

- 1. The establishment of Child Welfare Stations in each prefecture for temporary care, mental, psychological and physical examinations, and placement.
- 2. Provision for paid full-time child welfare officials who will work directly with children in cities, towns and villages.
- 3. National and prefectural Child Welfare Boards for the purpose of investigating and discussing the problems of welfare of children and expectant and nursing mothers.
- 4. Provision of Maternal and Child Handbooks to pregnant women which will provide certain additional ration privileges.
- 5. Free medical examinations for children whose parents are unable to pay for such service and a program for physical rehabilitation of crippled children.
- 6, Free parental, post-natal, and delivery for thos unable to pay for such service.
  - 7. Free hospital services for those of special need.
  - 8. Prevention of abuse and exploitation of children.
- 9. Matching funds for maternity homes, infant homes, homes for weak children (municipally or prefecturally owned and operated).
- 10. Minimum standards, licensing and official supervision of all children's agencies including Mother's and Children's institutions, with provision that licenses will be withdrawn when agencies fall below minimum standards.
  - 11. Provision of penalties for illegal acts.

The law is based on a proposed Bill submitted to the Ministry of Welfare by the Japan Social Work Association. It provides certain essential requirements and will form a basis for an adequate child welfare program.

# Licensed Agencies for Relief in Asia (LARA)

The 32nd, 33rd and 34th overseas shipments of relief supplies have been received by LARA. The relief items contained in this shipments were as follows:

32nd Shipment: Clothing 13.13 tons - Food 4.20 tons

33rd Shipment: Clothing (including shoes) 1.42tons

34th Shipment: Food 5 tons.

Restricted

Office Expenses Provided to Institutions

Monthly reports from Military Government Teams indicate that the policy allowing payments to institutions for persons receiving aid under the Daily Life Security Law continues to cause difficulty. A Summary of the regulation setting forth the basic policy is contained in Public Health and Welfare Weekly Bulletin No. 36 for period 30 August - 6 September.

The Ministry of Welfare has issued three pertinent orders on this subject. They are Hatsu-sha No. 103, dated 12 December 1946: Hatsu-sha No. 95 dated 8 August 1947; and Hatsu-sha No. 110 dated 15 September 1947. No. 110 states in part with reference to "protective institutions which provide merely accommodation" that, "the matter seems to suffer a loose interpretation and in some of these institutions the entire inmates are considered as receiving protection under the present law. The purpose of the communication was to urge you to ascertain with each individual family the concrete facts that these persons are barely able to support themselves without receiving money assistance for living if the accommodation is provided free of charge, but that they would need assistance for rents as soon as the free accommodation is deprived. You are requested to fully understand this point, to study the family under this category carefully before deciding them eligible, and to continually study their living conditions, in order to reserve this provision only for those truly falling under this category."

## Military Government Welfare Officers

The following list of Welfare Officers has been provided by Military Government Section, Fighth Army:

### REGIONAL WELFARE OFFICERS

Hokkaido District
IX Corps
Tohoku Region (see IX Corps)
Kanto Region
Tokai-Hokuri ku Region
Chugoku Region
I Corps

Kinki Region (see I Corps) Shikoku Region Kyushu Region Tokyo-Kanagawa MG District Mr. John Comway Capt. Howard B. Dow

Capt. Robert Nerrie
Mr. Daniel Britton
Capt. Eugene H. Cantley
Lt.Col. Charlie Brock
Mr. Max Meyer

#### SECTION II

#### NURSING AFFAIRS DIVISION

### Personnel

Miss Kikue Shimizu, Chief of Public Health Nursing Division of the Institute of Public Health was promoted from 3rd class to 2nd class official on 30 October. She is the first Japanese Nurse to be appointed to this position, which is a very important step in the history of nursing in Japan.

#### SECTION III

### VETERINARY AFFAIRS DIVISION

#### General

A physical examination on 58 head of riding horses was made prior to their shipment to Korea on 19 November 1947.

### Weekly Animal Disease Report

The Ministry of Agriculture and Forestry reported the following new outbreaks of animal diseases for the period 16-22 November 1947.

Prefecture	<u>Disease</u>	No. of Cases
Niigata Tochigi	Swine Erysipelas Swine Erysipelas	1

Bestricted

Restricted SECTION IV

#### SUPPLY DIVISION

### Distribution

Information has been received to the effect that in one prefecture Japanese-produced penicillin must be purchased through the Penicillin Association in Tokyo. This matter is now being investigated since the Penicillin Association is organized as a typical trade association and does not have authority to engage in distribution of finished products or allocation of raw materials.

Under present distribution policies, penicillin is allocated to prefectures by the Ministry of Welfare and distribution at the prefectural level is the responsibility of local prefectural officials.

Insect and rodent control equipment was shipped to seven prefectures in the period 11 - 17 November. A total of 1,302 pieces were distributed as follows:

Prefecture	DDT Duster	Knapsack Sprayer	Semiautomatic Sprayer	Hand Sprayer
Hokkaido	888	0	0	0
Fukushima	0	85	85	0
Saitama	0	0	6	0
Aichi	0	30	0	0
Kyoto	0	0	0	40
Wakayama	0	12	0	12
Hiroshima	24	60	36	24_
Total	912	187	127	76

During the recent flood disaster, a total of ¥3,439,011.30 value of medical supplies was furnished to seven affected prefectures: Tokyo, Chiba, Sai tama, Tochigi, Ibaraki, Gumma and Iwate.

The problem of maintenance of U.S. Army surplus vehicles which were released to the Ministry of Welfare and distributed by them to prefectures for use in public health activities has been raised. The importance of proper and adequate maintenance cannot be overemphasized, if these vehicles are to continue to be of benefit. Policies and procedures which will govern this maintenance are to be established as soon as possible and information will appear in subsequent Weekly Bulletins.

Recently it was discovered that some installations are still ordering x-ray film through the Anti-Tuberculosis Association. Neither this association nor any of its branches are recognized distribution agencies. Lists of authorized film agencies have been published in recent issues of the Weekly Bulletin. The Ministry of Welfare has issued an official letter to all prefecture health sections, file YAKU 1409, dated 19 November, which reiterates current x-ray film distribution procedure, but allows the Anti-Tuberculosis Association to dispose of any stocks they may have on hand. At the same time a letter was dispatched to the central Anti-Tuberculosis Association, file YAKU 1409, dated 19 November, requesting that they inform their branches of the present film distribution procedure.

### Production

The 32nd weekly report of DDT duster and spraying equipment for mosquito and fly control program for 1947 indicates the following data for the period 9 - 15 November:

Total	123,370	lbs.	35,050 gals.	55,735 vials

A total of 3,727,761 pounds of 10% DDT Dust and 146,870 gallons of 5% DDT Residual Effect Spray, 493,594 vials of Typhus Vaccine represents stocks in wholesale warehouses of the Ministry of Welfare, Japanese Government, as of 15 November.

### Narcotics

SCAPIN 1821, dated 18 November 1947, subject: "Disposition of Heroin", directs that heroin will not be delivered to Occupation Forces for destruction, but will be confiscated and delivered to prefectural narcotic officials who will report the scizure to the Ministry of Welfare, forwarding the heroin to a registered narcotic dealer in Tokyo, (designated by the Ministry of Welfare) for salvaging and conversion into medicinal narcotics.

No difference in procedure by Occupational Forces is intended as a result of the directive except that seized Japanese narcotics, when they are no longer needed as evidence, will not be stored in custody or destroyed but will be properly disposed of through Japanese narcotic officials. The present organization of Japanese narcotic enforcement personnel throughout Japan, whereby all narcotics are strictly accounted for, make this procedure possible with the result that all illicit narcotics will be salvaged for the medical needs of the Japanese people.

Report has been received that a quantity of blank narcotic forms were confiscated by Tokyo narcotic agents who found the forms being used to wrap merchandise in a Tokyo store. Preliminary investigation indicates the forms were taken from the warehouse of the Ministry of Welfare during the moving of three Bureaus from their present location to a new building. It is imperative that all prefectures, from an economic as well as from a security point of view, store official papers and forms with adequate security.

Restricted SECTION V

#### PREVENTIVE MEDICINE DIVISION

### Typhus Fever

Typhus Control Conference. The second in the series of conferences relating to typhus fever was held in Tokyo on 13 and 14 November. Representatives from 18 prefectures of norther Honshu were in attendance. The third conference is scheduled to convene in Kyoto on 2 and 3 of December for prefectural health officials from southern Honshu.

Complement fixation test. Of the two laboratory tests (Weil Felix and Complement Fixation) useful in the diagnosis of typhus fever, the complement fixation test is the more specific. During the 1946-1947 typhus season an attempt was made to clarify the typhus picture in Japan. A total of 646 serum samples from suspect cases were tested with the following results:

Epidemic (louse-borne	)	103
Murine (flea-borne)		278
Undetermined type		167
Negative		98
		646

This figure 646 represents slightly over 50% of the total of 1178 cases reported between 1 January to 18 November 1947. More samples were received but could not be used because of contamination of specimens.

In order to clarify further the picture of type and distribution of typhus fever it is suggested that serum samples be obtained from each case during the coming typhus season and shipped as soon as possible under ice to the 406th Medical General Laboratory in Tokyo. Complement-fixation anti-bodies begin to appear in the blood stream during the second week of the disease. Blood samples for this test should be drawn from about the tenth to fourteenth day of illness.

Data accompanying each sample should include the name, age and sex of patient, locality, (town and prefecture) date of onset; date of bloodsample, and date of vaccination against typhus (if any). The facilities of the RTO should be used in shipment of samples.

The Weil-Felix agglutination test using Proteus OX-19 should continue to be used. This test is positive after the 6th day of the disease. However, a series of 2-3 samples should be taken in order to determine a definite rise in titre. This test is indicative of typhus but will not serve to differentiate between the epidemic and murine types.

### Immunization

Based on results of complement fixation tests performed on submitted serum samples from reported cases of typhus during the past 1946-1947 season, epidemic typhus is the type encountered in the prefectures of Hokkaido, Akita, Miyagi, Yamagata, Fukushima and Tochigi. Murine Typhus was the predominant type in the remaining prefectures from which cases were reported. Epidemic typhus fever can be eradicated or at least reduced to a low level of incidence in Japan. It is suggested that large scale immunization programs be instituted in the denser centers of population of the northernfoci mentioned above. Hokkaido has an extensive program underway. Programs are also being setup in Yamagata and Miyagi prefectures through the Ministry of

Restricted

Nelfare and prefectural health authorities. 10,000,000 cc of U.S. Dox-type vaccine are available for this immunization program. Since this U.S. imported vaccine is nearing its expiration date, it should be used during the next two or three months.

The recommended course of immunization is 2 cc given subcutaneously at a seven to ten day interval, followed by a third booster dose collection in six months. It has been shown that the booster dose following the initial doses stimulates a higher degree of immunity in the individual than do the original 2 cc. In addition to the imported vaccine, approximately 5,000,000 cc of Japanese manufactured and assayed typhowaccine are also available. This vaccine could serve for handling routine immunization as cases develop, as well as for administering a third booster dose. Administration of 1 cc of vaccine may be the onloway in some instances and is better than no vaccine at all. Cases certainly will be more mild and the fatality from typhus cases greatly reduced.

### Tuberculosis Control

During the past month an inspection trip was made into four of the western coastal prefectures. Lectures and demonstrations given in each prefecture stimulated the interests to organize the efforts of the general population to control tuberculosis.

People are now becoming vitally interested and want to know "whe may I do to help prevent the spread of tuberculosis?" With that general attitude on the part of the public, their education in tuberculosis control is progressing.

### Port Quaranti ne

The attention of port quarantine officers is called to the fact that the cholera epidemic in Egypt is still continuing, although the incidence of the disease is decreasing at the present time.

There exists apparently some difference of opinion among the quarantine officers at the several repatriation centers regarding methods of cleaning and disinfecting of repatriation ships and the proper applications of materials. In order to avoid confusion among masters and crews, port quarantine officers are requested to come to an agreement among themselves as to requirements and standards for cleaning and disinfection and the use of DDT preparations for that purpose.

### Rodent Control

Method of Using Antu

Antu comes in the form of a fine bluis-gray powder. It is highlinsoluble, stable to heat, and deteriorates very little if at all during several years dry storage. It has no perceptible odor, and only a very transient bitter taste.

Antu mixes evenly with all kinds of food or ground grain and adheres well to dry or wet foods when dusted on them. It sticks to the feet and hair of rats when the rats run through it. It dusts welfrom insect dust sprayers and pump guns such as used for cyanogas powder.

Antu kills through the stomach, not through contact with the skin. Rats die when they lick it off their feet or eat it in their food. Antu acts chiefly on the lungs. Within a few hours after poisoning the lungs and the thoracic cavity become filled so that the rats drown in their own fluid. They die usually within 10 to 24 hour Their breathing difficulty tends to drive them to the outside.

Restricted

Restricted

Antu is a single shot poison. It is not an accumulative poison. Everything depends on getting a fatal amount of poison into the rate at the first meal, since after eating a sublethal dose they develop a tolerance which lasts about 30 days and an aversion which may last several months.

How to Use Antu

a. In ground baits

Thoroughly mix 2 or 3 parts of Antu with 100 parts of finely ground grain, preferably a high grade of yellow corn. Distribute in small shallow piles.

b. Dusted on baits.

Place freshly ground yellow corn or other grains in small piles on floor or earth and smooth out to a flat thin layer about \$\frac{1}{4}\$ inch in thickness. Dust the grain and surrounding areas for 6 inches with Antu, using a small spray gun, duster, or shaker. Use diced apples, sweet potatoes, tomatoes, cantaloupes, watermelons, ground meat, and the white and yolk of eggs, fish or chicken heads in the same manner.

Dust Antu on fresh ears of corn, the kernels of which may have been slit by running a sharp knife lengthwise along the cob. Cut the cob into 1 inch sections and distribute. (Very useful for distribution in inaccessible places.)

c. Dusted on floor and on runways without baits.

Spread a 50 percent mixture of Antu and flour over ground in areas which rats frequent, especially along runways and near openings.

d. Pumped in burrows.

Pump Antu powder (or flour-Antu mixture as in No. 3) into openings of rat burrows with foot or hand duster until floor of burrow is well coated.

e. Dusted on water or mixed with water.

Use small shallow cups or dishes. Dust Antu on water until it forms a thin film on surface; or put 1 to 2 parts of Antu with 100 parts of water in a bottle, shake well, and pour into a shallow dish. After being shaken up with water tends to settle within a few hours so that repeated shaking or stirring may be necessary.

For best results use several methods (at least Nos. a, b and e) at the same time. Try to provide an excess of bait for all suspected rats, but do not throw bait around carelessly. Make the rat's first poisoning its last meal.

Use those baits that are most attractive to local rats during the season of poisoning operations. Yellow corn is practically a complete food and is almost universally attractive, used either when fresh ground or fresh on the cob.

In grocery stores or other places where food is available at all times make liberal use of poisoned water.

· Restricted

Restricted
SECTION VI

### MEDICAL SERVICE DIVISION

Civilian Hospital Strength Report for period ending 31 October 1947 shows 3,389hospitals with a capacity of 212,100 beds of which 97,991 were occupied. During this same period 238,196 out-patients were treated.

#### SECTION VII

#### SOCIAL SECURITY DIVISION

The Diet passed on Unemployment Allowance Law and the Unemployment Insurance Law to become effective as of 1 November. The initial claim will be paid by the Unemployment Allowance Law and will become valid after 1 November 1947 for unemployment wage losses on and after 1 October 1947. The Unemployment Insurance Law begins collecting contributions as of 1 November 1947 and claims under this become valid on and after 1 April 1948.

The above mentioned laws add another Social Insurance in the overall Social Security program for Japan. The new Ministry of Labor will have the administrative responsibility of these two laws.

### SECTION VIII

#### NUTRITION

Data on the proportion of certain foods or food groups obtained from the ration, free market, home production and gifts, in Tokyo and the average of eight cities during the Rice-Year 1946-1947, are contained in the accompanying tables. The data include total staple foods and rice, other grains, sweet potatoes and other potatoes which constitute the staple foods as well as legumes, fish, meat, poultry, eggs and milk, leafy green and yellow vegetables and other vegetables.

Monthly Summary of Vital Statistics in Japan: September 1947

The vital statistics for Japan and each prefecture during September 1947 are summarized in the attached tables. The numbers reported are from the monthly schedule report of the Bureau of Public Health, Ministry of Welfare. Rates are based upon the estimated population as of 1 July 1947.

Births: There were 235,896 births reported in September compared with 240,709 in August. The birth rate per 1,000 population in September (36.8) was approximately the same as in the previous month (36.3). The slight increase in the annual rate this month as compared to last month, despite the smaller number of births reported is accounted for by the fact that September was a 30 day month, whereas the preceding month had 31 days. The median monthly rate for September during the 7 year period, 1935-1941 was 29.1. The birth rate in September 1946 was 31.1.

Deaths: Deaths dropped from 96,238 in August to 80,036 currently. The death rate decreased approximately 14 percent, from 14.5 to 12.5. This is in conformity with the usual season pattern. In previous years the death rate rose to a peak in August and started to decline in September. The median death rate for the 7 year period 1935-1941 was 18.3 in August, compared with 17.0 in September. The current death rate (12.5) was more than 25 percent less than the median September rate and approximately 31 percent lower than the death rate in September 1946 (18.2).

During September 1947, deaths and death rates per 100,000 pepulation for the 10 leading causes of death (excluding cancer and other malignant tumors) were: tuberculosis, (11,843) and (184.7); intracranial lesions of vascular origin, (6,505) and (101.5); diarrhea and enteritis, under 2 years of age, (5,665) and (88.4); diarrhea and enteritis, 2 years of age and over, (4,785) and (74.6); senility, (4,662) and (72.7); accidental deaths, (4,196) and (65.5); nephritis, (3,293) and (51.4); pneumonia, (2,629) and (41.0); congenital debility, (2,162) and (33.7); and dysentery, (1,591) and (24.8). The 10 causes listed here accounted for approximately 60 percent of all deaths in September.

Infant Deaths: Infant deaths totaled 11,122 in September compared with 15,493 in August. The infant death rate per 1,000 live births in September (47.1) was more than 25 percent less than in August (64.4). The current rate remained well below the median September rate (64.3) for the period 1938-1942 and slightly lower than the infant death rate in the corresponding month last year (48.6).

Stillbirths: The number of stillbirths in September (10,668) was somewhat lower than in the preceding month (10,742). The rate per 1,000 live births, however, increased slightly from 44.6 in August to 45.2 currently. Since stillbirth rates are estimated per 1,000 live births, the decrease in the number of births this month resulted in a higher stillbirth rate, although the number of stillbirths has decreased. The median September rate from 1935 - 1941 was 53.5. In September 1946, the stillbirth rate was 38.4.

Marriages: Marriages totalled 72,080 in September compared with 63,594 in the previous month. The current marriage rate per 1,000 population (11.2) was nearly 17 percent greater than in August (9.6). The median marriage rates for August and September from 1932 to 1938 were 5.9 and 7.0 respectively. The rate for the corresponding month in 1946 was 9.9.

Divorces: The number of divorces in September (7,325) increased about 10% from the August figure (6,668). The divorce rates per 1,000 population, in August and September were 1.0 and 1.1 respectively. The median rate for September 1932-1938 was 0.7. The divorce rate for September 1946 was 1.9.

<sup>\*</sup> Rates per 1,000 population per annum (estimated 1 July 1947) \*\* Rates per 1,000 live births

Table prepared by Vital Statistics Division, Public Health and Welfar Section, GHQ, SCAP, 28 November 1947.

### DIGITAL OF TURLY RU ORT OF COMMUNICABLE DISE DES IN JULYAN FOR THE METRIC LADING 15 NOVEMBER 1947

The total number of communicable disease cases (10,366) reported for the week ending 15 November was nearly 8 percent greater than the number (9,628) reported in the preceding week. The current higher number was due to increases in tuberculosis, pneumonia, whooping cough and influenza. Approximately 88 percent of the total cases were credited to: tuberculosis (6,071), pneumonia (1,663), whooping cough (830), measles (510), and influenza (47).

Only 12 percent of all cases were credited to the remaining 12 communicable diseases included in this report. These 12 acute diseases accounted for 1,245 cases and 186 deaths currently compared with 1,335 cases and 169 deaths last week.

The incidence of all acute communicable diseases either declined or remained about the same. Of these diseases, more than 80 percent of the cases and 90 percent of the deaths were due to diphtheria (543 cases and 43 deaths), typhoid fever (260 cases and 49 deaths), and dysentery (220 cases and 78 deaths).

Diphtheria cases decreased approximately 5 percent from 571 to 543. There were 43 deaths currently compared with 46 recorded last week. The current and cumulative case rates per 100,000 population per annum were 36.3 and 36.5 respectively. Corresponding death rates were 2.9 and 3.0.

The incidence of dysentery continued to decline. The current cases (220) were 15 percent less than the number (260) reported in the preceding week. Deaths, however, showed an increase from 62 to 78. The current and cumulative case rates were 14.7 and 56.4 respectively. Corresponding death rates were 5.2 and 10.4.

There were 260 cases and 49 deaths reported during the current week for typhoid fever, compared with 265 cases, and 42 deaths in the preceding week. The current and cumulative case rates were 17.4 and 24.4 respectively. Corresponding death rates were 3.3 and 3.0.

Paratyphoid fever cases (62) were about the same as last week (59). There were 5 deaths currently compared with 7 last week. Both the current case and death rates (4.1 and 0.3 respectively) were less than the corresponding cumulative rates (6.5 and 0.4).

No smallpox cases have been reported in the last 3 weeks. There have been no deaths recorded in nearly 4 months. The cumulative case and death rates were 0.6 and 0.1 respectively.

Only 3 cases of typhus fever were reported currently compared with 7 last week. No deaths have been reported in the last 4 weeks. The current and cumulative case rates were 0.2 and 1.5 respectively. The cumulative death rate was 0.1.

Malaria cases (99) remained about the same as last week's low level (95). No deaths were reported in the current week compared with 1 last week. The current case rate (6.6) was 60 percent less than the cumulative case rate (16.5). The cumulative death rate was 0.03.

The actual number of scarlet fever cases in the current week was 54, but corrections in 3 prefectures (Lomori, Kochi, and Kumamoto) brough the current net total down to 40. The current and cumulative case rates were 2.7 and 3.4 respectively. Both current and cumulative death rates were 0.1. (There would have been little change in scarlet fever cases had these 14 cases not been reported in error last week). The Weekly Report shows 40 cases and 2 deaths in the current week compared with 61 cases and no deaths last week.

Expidemic meningitis accounted for 18 cases and 9 deaths currently compared with 20 cases and 10 deaths in the preceding week. The current and cumulative case rates were 1.2 and 4.7 respectively. Corresponding death rates were 0.6 and 1.5.

There were no cases or deaths reported for suspect Japanesé "B" encephalitis in the current week compared with 1 case and 1 death last week. The cumulative case and death rates were 0.4 and 0.2 respectively.

There continued to be no Cholera or Plague.

The current and cumulative number of cases of chancroid were 878 and 36,165 respectively; for genorrhea 4,294 and 188,911; and for syphilis 3,162 and 129,583.

### SUMMARY REPORT OF CASES AND DEATHS FROM COMMUNICABLE DISEASES IN JAPAN

Week Ending 15 November 1947
